The straightforward goal of Photoshop is to edit all your digital photos, adjust them, and make them look great. The great news is that Photoshop gives you the power to do just that. You can easily turn a photo into a time-lapse movie. Or edit an image to give it a grunge look. Or fix everything in a photo that's gone wrong. As you get more experienced, you can start using some of Photoshop's hidden power to your advantage. For example, you can work with layers to change a photo in several stages. You can change the look of the skin of someone in a photo by making a selection around the skin and then dragging that layer to another position on the photo. You can distort someone's face, so that if you enlarge that photo, the features appear blown out. Or you can use layers to create an entire photo story, such as a photo album, a holiday greeting card, or even a comic book. Layers enable you to overlay text or drawings on a photo. You can even create a photo-book template and use it to rapidly create a variety of different photo collages. Working with Layers and Channels Photoshop is designed for editing raster images. Anything in your digital world that is rasterized — such as a photo or a drawing — is created as a grid of pixels and has a grid of lines, called the pixel grid. These lines create the edges of the objects in a picture. Layers are a conceptual concept in Photoshop. Basically, they're groups of image elements that you drag into Photoshop and then connect them to one another to create complex image elements such as textures, brush strokes, shapes, and other things. In Photoshop, you have four main, frequently used types of image elements: layers, paths, selections, and channels. Layers are the most important elements in Photoshop because they contain your image elements. This section takes a closer look at each type. Layers and Photoshop The best way to understand the layers and channels in Photoshop is to start by looking at some simple images. Next, you have to consider the most common types of image editing in Photoshop: selection, masking, painting, and adjustment layers. The concept of layers is actually quite simple. You take an image and create layers by combining image elements. You can either delete layers or copy them to other layers. At the bottom of a working image, you usually find a number of layers that

Q: Algorithm for determining country from IP I have an IP address and I want to find out which country that address belongs to. Is there any good open source/free software or algorithm (preferably in C) that can do this? I know it is relatively easy to do the opposite of this; i.e., given a country code, determine an IP address. A: IPs are globally unique. The IPv4 address format is not, though, so no country could ever assign more addresses in total than there are in the IPv4 range. However, the fact that a country has assigned addresses within its assigned range is enough to determine it. This could be done by parsing a human-readable country code (e.g. FR, DE, US) to get the assigned range, and checking which IPs fall within this range. If no address falls within the range, then the country is not in that list. Alternatively, you could find the top-level domain (e.g..de or.us) of the country and check if the address matches that pattern. This will also work for dynamic domains like.com or.mobi, for which you only get the TLD by examining the address. A: In your case, I suspect that no sufficiently-powerful algorithm will be able to do this. First, the WHOIS service (which people often use to find out IP address owners) returns the information as simple text, so any complex algorithm will need to be able to write down a text representation of the results, and any text representation will be longer than the information you care about. Second, IP addresses are unique, so it is entirely possible for two countries to share the same assigned range of IP addresses. The only exception to this is if you are using a collapsed domain, which is then typically handled by the registrar. For example, if the.uk registry is already so completely loaded (ie, all available non-HPA addresses have been reserved), then all future registrations will be considered invalid. I do not believe any algorithm will be able to determine IP address ownership from IP address alone. 1. The Content-Aware Resampling tool allows you to either reduce or increase the resolution of an image. It is also referred to as image scaling. The Burn tool allows you to make an area transparent by increasing the alpha channel of a pixel, and can be used to erase small objects from an image. The Content-Aware Fill tool is a feature that allows you to replace content from one area of an image with content from another. For example, if you had a shoe outline on an image, and filled in the rest with unknown content, this tool can be used to "learn" that unknown content and replace it with the definition of the shoe outline. The Healing tool replaces pixels that are out of place on an image. This can be used to remove small blemishes or spots of dust or dirt. The Mask tool allows you to protect or reveal parts of an image by completely or partially hiding them. This can be useful for cutting objects out from an image, or for adding and removing elements such as fireflies or a close up of a face. The Pen tool allows you to draw objects, lines, and paths on images, and can be used to create basic designs such as a star, a sun, or a logo. Effects

Photoshop includes a variety of effects that can be added to an image. These include Crop, Posterize, Saturate, Tone, Reduce Noise, Blur, Sharpen, Emboss, and Grain. The Crop tool allows you to crop or trim an image. It also allows you to crop an image in portions. This can be used to trim your images to a specific resolution, crop out unwanted areas, or remove a person from a picture without having them appear digitally removed or vanish from the photograph entirely. The Posterize effect applies a "graduated" filter to an image that gradually reduces and then removes the brightness or contrast of an image. This can be used to reduce the amount of light in an image, or to apply a soft filter to make an image look old and faded. The Saturate effect allows you to preserve the average brightness of an image, while increasing or decreasing the brightness of its most intense colors. It can also be used to make an image appear more faded, with a gradient effect that shows its old and new appearance. The Tone tool allows you to add contrast
